01 Papers — the summary moves onto the card

Today's highlights block disappears. The one- or two-sentence summary it used to hold is printed on the paper's own card, where you were already looking. Everything else on the card stays put.

TODAY · BEFORE

TODAY'S HIGHLIGHTS

1. • A new pathway for anti-perovskite electrolytes lifts room-temperature conductivity past the sulfide benchmark...
2. • Operando X-ray shows dendrite nucleation begins at grain boundaries, not the interface...

PAPER

86%

TODAY · AFTER

NEW

PAPER

86%

Anti-perovskite solid electrolytes with grain-boundary engineering

Y. Nakamura, L. Ferreira +6 · Nature Energy

Doping the grain boundaries with fluorine pushes room-temperature conductivity to 3.2 mS/cm — past the sulfide benchmark — without the moisture sensitivity that usually comes with it.

Why you · interfacial resistance, solid-state electrolytes

Anti-perovskite solid electrolytes with grain-boundary engineering

Y. Nakamura, L. Ferreira +6 · Nature Energy

Matches your required topic *solid-state electrolytes* and your current project on interfacial resistance.

The summary and the card said different things in different places. You read the block, then hunted for the matching card.

ARXIV

♥ · ✕ · ☰

Operando imaging of dendrite nucleation in garnet separators

S. Adeyemi +3 · Joule

Nucleation starts at grain boundaries several microns inside the separator, not at the lithium interface — which reverses the usual coating-first mitigation strategy.

Fallback: with no AI key configured, the card prints the first sentences of the abstract instead. Nothing goes blank.

02 Job report

Everything you asked for, ordered by the question it answers: can I do this, what does it pay, where and when, by when do I have to act, and where do I apply. Fields Peer can't find are hidden rather than shown empty.

Cell assembly ✓

Materials characterization ✓

Pouch-cell scale-up

DFT / MD simulation

Japanese (helpful)

Highlighted chips come from your Required and Explore topics plus your project text. The plain ones are the gaps — worth seeing before you spend an evening on the application.

WHAT THE ROLE IS

- Build and characterize sulfide/oxide hybrid interfaces for automotive-scale cells.
- Own the operando cell design; work alongside the pilot line in Japan.
- Publish, and file at least one patent per year.

TO APPLY, HAVE READY

- | | |
|-------------|---|
| MATERIALS | CV, 1-page research statement, 3 references |
| ELIGIBILITY | PhD awarded by start date |
| TEAM | Energy & Materials, 14 researchers |
| SEEN ON | Adzuna · reposted from employer site |

WHY PEER SENT THIS TO YOU

TIER 0

Matches 3 of your required topics — *solid-state electrolytes*, *interfacial resistance*, *operando imaging* — at postdoc level, in California, which you filtered toward 4 times this week.

ALSO IN THIS REPORT WITH AN AI KEY

Connect a key

How competitive this actually is

Reads the requirements against your CV-level profile and says where you'd stand.

Sponsorship read when the posting is silent

Judges this employer's track record instead of leaving it at "not stated".

The role in three clean sentences

Rewritten from the posting rather than the posting's own best sentences.

What to emphasise in your application

Which of your papers and methods to lead with, given this team's work.

Everything above the locked block is built with no AI key: the source APIs give salary, type, location and dates; the posting page gives the deadline, start date, visa sentence and materials by pattern-matching; the skills split is plain string matching against your topics. **Nothing in the report is a stub waiting for a key.**

03 Event report

Same skeleton as the job report, different questions: what kind of event is this, what happens there that concerns me, who will be in the room, what does it cost, and what are the two dates I can miss.

CHEAPEST WAY IN, FOR YOU

Student ticket in person before Jan 9, with a travel grant — \$180, applied for alongside the abstract you were going to write anyway.

TWO DEADLINES, ONE EVENT

WHAT ACTUALLY HAPPENS THERE

NEW

Poster session — open call ✓

Symposium: solid-state interfaces ✓

Recruiting fair, day 3 ✓

Tutorial: cell-scale modelling

Vendor exhibition

Early-career mixer

Highlighted because they line up with your topics and because you're a PhD 4 looking at industry — the poster call and the recruiting fair are the two you'd be sorry to miss.

Who'll be in the room

5 of 34 exhibitors and 3 of 18 speakers concern you

ORGANISATIONS

TIER 0

Toyota Research Institute

Hiring you looked at

Their energy-materials group publishes on sulfide/oxide hybrid interfaces — the same failure mode as your interfacial-resistance work.

At this event: booth on day 2–3, and they're running the recruiting fair table. You saved their postdoc on Jul 28.

QuantumScape

Matches 2 topics

Ceramic separator programme — closest industrial parallel to the dendrite-suppression question in your project text.

At this event: sponsor talk, day 1 afternoon — "Separator defects at scale".

Argonne National Laboratory

Posts internships

Runs the summer PhD internship you're watching, and their beamline is where most operando work in your feed is done.

At this event: two posters and a recruiting table on day 3.

04

Events widen past conferences

Career fairs, recruiting days, industry summits, expos and hackathons are events too. Each one carries its kind, and kind becomes a filter chip next to location and month.

EVENTS TAB · KIND FILTER **NEW**

Academic conference · 18

Workshop · 11

Career fair · 6

Industry summit · 5

Expo · 3

Seminar · 9

Hackathon · 2

Kind is inferred from the title and description, so it works for sources that don't label anything. Peer also starts searching for recruiting events on purpose instead of hoping a conference feed happens to list one.

05

Saved — split by kind, and it remembers what you applied to

One tap on the corner control and the card tints. Jobs have one control — *Applied*.

Events have two, stacked, because registering and submitting an abstract are separate acts with separate deadlines; either one tints the card, and whatever is still outstanding stays marked in red. The colour is picked per theme; see plate 12 for why it isn't green.

International Battery Materials Summit 2027

San Diego, US · Mar 8 – 11

Registered Jul 25 · abstract due Oct 30

One tick is enough to tint the card — you have acted on it. The outstanding deadline stays red on the card and in the Dashboard.

PAPER

no check

Anti-perovskite solid electrolytes with grain-boundary engineering

Nakamura +6 · Nature Energy

Nothing to apply to — papers keep the plain card.

Resting — faint outline, always visible

Hover — done-colour outline

Done — filled, word to its left, card tints

The same check sits on the job and event reports, so you can mark it the second you hit submit rather than coming back here. The state is stored with the saved item itself, so it follows you to another device. An event with both an abstract deadline and a registration deadline keeps both dates on the card — the check marks whichever you told Peer you care about.

06 All becomes Dashboard

The tab is renamed and repurposed. It answers four questions in one screen: what came in today, what am I holding, what's about to expire, and what have I actually done about it. How hard Peer worked is not one of the questions — the source breakdown and the “41 sources searched” headline are gone.

Done

Sorted by what runs out first, not by when you saved it. Green rows have nothing left to do and sink to the bottom — the top of this list is your week.

The model: one row per day — how many papers, events and jobs arrived and which of your topics they hit — plus the state of every item you saved: read, applied, registered, and its deadline. Kept in your browser for 90 days. No server, no AI key, nothing here can go blank.

07 Jobs — where and when, as a knob

Sits directly under the Jobs topics panel, in the same collapsible card, so Required / Explore / Where / When read as one control surface. Only *Where* takes typing — everything else is a fixed set of options or is generated from what today's pool actually contains, so the counts are always true. Every control filters today's pool the instant you touch it; the location you set also steers tomorrow's search.

Internship sits in this row as its own chip, next to location and month — so you can see at a glance that today produced 24 of them, and pull them out with one tap. That's the difference between internships being *present* in the pool and being *findable*.

08 Visa sponsorship, stated honestly

No job board has a sponsorship field, so this is read out of the posting text. Most postings say nothing at all — which means a yes/no switch would throw away three quarters of the pool. Three states, and Peer never claims more than the posting does.

Sponsors

The posting says so. Peer keeps the sentence and shows it on the report.

“visa sponsorship available” · “we sponsor H-1B” · “relocation and visa support”

Not stated

Silence. Stays in your results with a one-line read on how likely it is — university postdoc, national lab, big tech all behave very differently.

“University postdocs in the US usually sponsor J-1 or H-1B. Not confirmed here.”

Won't sponsor

Ruled out in writing. Hidden by default once you've said you need sponsorship — one tap brings them back.

“must be authorized to work without sponsorship”
· “US citizens only” · “active clearance required”

Where the switch lives: one line in your profile — *I need visa sponsorship, in the US*. The Jobs filter defaults from it, so you set it once and never think about it again. Peer marks a job irrelevant-by-country rather than risky when it's somewhere you can already work.

09 Internships get their own lane

Internships already scored well for PhD users, but nothing went looking for them — they only showed up when a general query happened to return one. Three fixes: a reserved slice of the search budget, the right hiring cycle, and a role-type chip so you can ask for them directly.

THE CARD, IN JULY 2026

INTERNSHIP

CPT / OPT ok

89%

PhD Research Intern — Battery Materials, Summer 2027

Argonne National Laboratory · Lemont, IL · 12 weeks

Twelve-week placement on the solid-state pilot line, aimed at PhD students two or more years from defending.

Applications open Sep 1 · close Nov 15

Internship postings for a summer open the previous autumn, so Peer searches the **next** cycle, not this one. Past cycles are already dropped.

WHAT CHANGES UNDERNEATH

QUERIES A fixed share of the job search budget goes to internship phrasings — research intern, PhD intern, co-op, summer placement, student researcher — so a general query can't crowd them out.

CYCLE The year in the query follows the hiring calendar, not the clock.

SOURCES National labs and company internship pages come from web discovery; the aggregators cover the rest.

VISA US internships are marked CPT/OPT-eligible rather than sponsorship-risky, so the visa filter never buries them.

OPT OUT On by default for PhD stages, off for postdocs and scientists, switchable in

10 What a report contains with no AI key at all

The rule: a report with no key is a *complete, shorter* report, never a skeleton with holes in it. Anything a model would have to reason about is left out entirely and named at the bottom instead. Nothing renders as “—”, nothing renders as “Peer could not extract this”.

Paper

TIER 0

- Title, authors, venue, date, links, citations
- Abstract split into intro and results
- Which of your topics it hits, and where
- Read time, recency, team size, code availability

NEEDS A KEY

- The one-sentence summary on the card
- Novelty, method bullets, key results read from the full PDF
- Figures matched to the claims they support

Job

TIER 0

- Salary, employment type, location, remote or hybrid
- Posted date, deadline, start date, contract length
- Visa sentence, quoted from the posting
- Skills you have vs the gaps, as a ratio
- The posting’s own three best sentences
- Application materials, role type, source

NEEDS A KEY

- How competitive you’d be
- Sponsorship read when the posting is silent
- The role rewritten in clean prose

Event

TIER 0

- Dates, venue, format, rank, scale

- Both deadlines and the countdown between them
- Fees, student rate, travel grants, visa letters
- Activities matched against a fixed vocabulary
- Organisations and people *you already have history with*

NEEDS A KEY

- Judging the attendees you've never seen before
- What each talk is actually about
- A day-by-day plan

Two things make this possible. Job and event data was **never** AI-generated in the first place — a model is only used to write better search queries, so scoring, matching and the extractive summary already run without one. And postings phrase the important facts in a small number of standard ways, which is exactly what pattern matching is good at: "Application deadline:", "Closing date", "must be authorized to work", "Registration fee", "early bird".

The locked block, everywhere: same position at the foot of every report, real section titles, one line each on what it would do, grey bars standing in for the text. Never fake sample content, never a countdown, never a pop-up. It says what you're missing and gets out of the way.

11 Work authorisation is a country list, not a switch

Peer searches globally — remote boards, a European aggregator, a US federal source, and open web discovery all feed the same pool — so "do you need sponsorship" has no single answer. It depends on where the job is. The setup step therefore asks where you can *already* work, and every posting is then judged against its own country.

Where can you already work without a sponsor?

Citizenship, permanent residency, or an existing permit. Everywhere else, Peer assumes you'd need one.

China ✕

United States — F-1, OPT ✕

+ add a country

WHAT THIS DOES

Jobs in China visa never mentioned

US jobs, permanent flagged — you'd need H-1B sponsorship

US internships fine — CPT/OPT covers them

Jobs in the UK, EU, Canada... flagged, in that country's own terms

Events are separate. Conferences need a visitor visa and an invitation letter, not sponsorship — the event report handles that on its own and this setting doesn't touch it.

Back

Continue

Why a list and not a yes/no: the phrases Peer looks for are country-specific. A US posting says "H-1B", "must be authorized to work in the US", "CPT/OPT". A British one says "Skilled Worker visa", "right to work in the UK". A German one says "EU Blue Card". One global switch would apply US rules to a Munich job. Peer ships phrase sets for the US, UK, EU, Canada and Australia — which covers most English-language postings — and falls back to generic wording ("visa sponsorship", "work authorisation") everywhere else.

The CPT/OPT exception for internships is **US-only** and only fires when the posting is in the US. A UK or German internship gets that country's own rules, and where Peer has no phrase set it says nothing rather than guessing.

12 The "done" colour, across all six themes

Green was the obvious choice and it's wrong: saved job and event cards are *already* tinted green by match quality, from a fixed green that deliberately ignores the accent. An applied card would be indistinguishable from a well-matched one. Blue is unclaimed in Peer's palette, cool against every warm ground, and reads as filed rather than urgent.

ACCENT → DONE, LIGHT MODE

Ember

ACCENT

DONE

#ff520d → #2b5c8f

Rose

ACCENT

DONE

#e0347c → #2b5c8f

Marigold

ACCENT

DONE

#d98e04 → #2b5c8f

Sage

ACCENT

DONE

#2e7d5b → #2b5c8f

Indigo · exception

ACCENT

DONE

#3f5bd9 → #0f6f6a teal

Violet

ACCENT

DONE

#7a3fd9 → #2b5c8f

ACCENT → DONE, DARK MODE

Ember

ACCENT

Indigo · exception

ACCENT

DONE

#7a90f2 → #4fb3ac teal

Violet

ACCENT

DONE

#a078f0 → #7aaee0

The rule that generated these: pick the hue furthest from the accent that isn't already spoken for — green means match quality, red means destructive, amber means warning — then drop its saturation about a third below the accent so it settles instead of shouting. Blue satisfies that for five accents. Indigo is the one accent that is blue, so it takes a deep teal instead.

Colour is never the only signal. The word — Applied, Registered, Submitted — always sits beside the mark, and the mark is a filled check. Someone who can't separate blue from orange still reads the state, and so does anyone glancing at a phone in sunlight.
